6. AT HOME ACTIONS

Inspiring at home actions individuals can take

7. FAITH IN ACTION

Reflections and perspectives from different faith traditions about the spiritual significance of water

8. ADDITIONAL RESOURCES

INTRODUCTION TO SALT WATCH

IPC engages congregations in caring for our shared watershed by raising awareness and providing hands-on assistance for projects like rain gardens and tree plantings. Our mission is to inspire and equip people of faith to honor, protect, and restore our shared watershed.

Founded in 1922, the Izaak Walton League (IWLA) is one of the nation's oldest and most respected conservation organizations. With a powerful grassroots network of nearly 200 local chapters nationwide, the League takes a common-sense approach toward protecting our country's natural heritage and improving outdoor recreation opportunities for all Americans (iwla.org).

In 2017, a Clean Water Fellow at the IWLA noticed a huge pile of salt left by a salt truck sitting directly next to a storm drain. Inspired by the success of the League's Save Our Streams community science program, IWLA staff launched Salt Watch (saltwatch.org) to mobilize community scientists to monitor chloride (salt) levels in local creeks and streams. Volunteers can share and use this data with their local watershed groups, neighbors, and local government. By raising awareness and using real data, we can create meaningful behavior change.

ROAD SALT FACTS: WHY REDUCE OUR USE?

Road Salt is the most popular option used to de-ice roads and highways. Road salt is everywhere during winter months. It keeps us safe on roads and sidewalks, but it can also pose a threat to fish and wildlife as well as human health. Towns, cities, businesses, and individuals dump roughly 10-20 million tons of salt every year, depending on the winter weather conditions. As snow melts or rain falls, that salt gets washed into our storm drains, our streams, and even into our drinking water.

"Pet friendly" or "environmentally safe" salts are becoming more and more popular - but these products are made of salts that still put chloride on the ground and into our water. **Even if we quit using road salt today, the salt already in the ground can persist for decades, and the salt content in our streams will rise as salt continues to percolate through the soil.**

ENVIRONMENTAL IMPACT

In the environment, chloride can dry out and kill vegetation, compact soil, and become toxic to fish and bugs that live in the 150 freshwater streams that all lead to the Bay!

Potomac River, MD

HUMAN HEALTH IMPACT

Road salt pollution may also cause health issues for people who are prescribed low-sodium diets for pre-existing health issues. Water utility services are not able to remove sodium or chloride from the source water, so it is critical to focus on the prevention of road salt pollution. High sodium levels can affect people with high blood pressure, and high chloride levels can be toxic to some fish, bugs, and amphibians. ***Help your community by taking the Salt Watch Pledge and [GET YOUR FREE kit by clicking this link!](#)**

PUBLIC SAFETY

It can damage roadways, bridges, vehicles, and other infrastructure including parking lots and sidewalks. Almost 15% of bridges across the US are structurally deficient due to corrosion, which is made worse by road salt.

Once you put salt down,
it doesn't go away...

Salt applied by cities,
businesses, and homes
adds up.

IMPACTS ON WATER QUALITY

Road salt pollution is the leading cause of chloride pollution in waterways throughout the United States. As previously mentioned road salt breaks down into sodium and chloride ions, which can each cause environmental and health problems in aquatic systems, wildlife, and humans. Chloride pollution also comes from other sources including water softener discharge and sewage discharge. The impact of chloride on human health is an area of ongoing research, but there are several health risks that are known to be linked to increased chloride in drinking water.

DRINKING WATER STANDARD

The drinking water standard for chloride is 250 mg/L, as established by the US Environmental Protection Agency (EPA) in 1988. At this level, water starts to taste "salty." There is no health-based guidance for chloride in drinking water, but there can be health implications for consuming sodium. Sodium and chloride concentrations in water are often related since sodium chloride (NaCl) is the most common type of road salt being applied in the winter. **The EPA recommends sodium in drinking water be less than 20 mg/L for individuals on severely restricted sodium diets.**

TREATING AND TESTING

Most water treatment plants are not equipped to remove chloride from water, yet are required to do so by the EPA once chloride levels exceed 250 mg/L. **This will likely put the cost of constructing and running new treatment plants on the taxpayers.**

Additionally, approximately 43 million Americans get their water from private wells, which are not regulated by the EPA. Well users are responsible for testing their own water. Most states recommend testing at least once every other year. **Refer to pages 2 and 8** for information on testing your water source.

BEST PRACTICES

CHESAPEAKE

Incorrect Amount

Correct Amount

HOW TO BE A SMART SALTER

SHOVEL

Clear walkways
before snow
turns to ice.

SCATTER

A 12 oz mug holds
enough salt to
treat a 20'
driveway or 10
sidewalk squares!

SWEEP

Sweep up
excess salt and
reuse it!

CONGREGATIONS TAKE ACTION

How clean are your congregation's streams?

Salt Watch is a national community science program where volunteers can order free kits to track levels of chloride in their local streams or drinking water. **This is a great activity for individuals, youth groups, homeschool co-ops, and small groups.** By raising awareness and using real data, we can make smarter and safer salting decisions!

1

Request your **free kit** at
www.saltwatch.org

2

Sample your
stream or drinking
water

3

Upload your
results to the
Clean Water Hub

4

Share your
findings with the
community

CONGREGATIONS TAKE ACTION

Be A Smart Salter

Who applies road salt to your facility's driveways, sidewalks, and parking lots in the winter? Share smart salting techniques with your grounds crew, contractor, or whoever applies salt. **By using less salt, you can protect your community and save money.**

Reminder:

Augment Your Stormwater Management Projects

Have you installed a rain garden, rain barrel, or impervious surface through Interfaith Partners for the Chesapeake? Excessive road salt may be damaging or hindering your stormwater management efforts. Increase your environmental impact through Smart Salting practices!

**Episcopal Church of the Ascension –
Gaithersburg Rain Garden Blessing**

Outreach & Education Opportunities

Hosting an educational event for congregation members that highlights the impact of road salt pollution and providing resources on how to test tap water is vital in road salt reduction. [Click HERE for more ways your congregation can take action](#) by hosting a salt reduction campaign in your community, including links to advocacy resources!

CONGREGATIONS TAKE ACTION

Join the Salt Watch

The Salt Watch program engages community members in a data collection opportunity to identify chloride pollution hotspots and empowers them to advocate for smart salting practices. Your Congregation can request free Salt Watch kits to quickly and easily test salt levels in local waterways and drinking water – a great activity for people of all ages!

Youth Groups

Salt Watch is a great service project for youth groups. It can also serve as an environmental education experience for homeschool co-ops. Students can collect data and/or participate in a [Paint the Plow event!](#)

Share With Your Congregation

We have graphics and flyers available in both English and Spanish [here](#) that you can include in your weekly bulletin or newsletter. Let your members know about this service opportunity that they can participate in individually or in groups by requesting their kit!

Learning Opportunities

Interested in learning more? Salt Watch staff can provide an in-person or virtual presentation to help your congregation get involved. **Email saltwatch@iwla.org to request a presentation.**

[Watch IPC's Learning Lab click HERE!](#)

INDIVIDUALS TAKE ACTION

Reduce your salt use to protect our sacred waters!

Do your own salt application!

1. Shovel

Clear snow from sidewalks and parking lots before it turns to ice. The more snow you remove, the less salt you'll have to use – and the more effective it will be!

2. Scatter

If you use salt, scatter it so there's space between the grains. A coffee mug of salt is enough to treat an entire 20 foot driveway!

3. Sweep

Once the salt has done its job, sweep up the extra so you can reuse it for later storms – and prevent it from washing away.

4. Switch

Salt doesn't work when the pavement temperature is 15 degrees or lower. Switch to sand or use a different deicer that works at low temperatures.

Hiring a snow removal contractor?

Choose a contractor who is certified through a winter salt certification program.

Use an alternative or use less salt!

The simplest way is to use less salt! Look at the **example on pages 4 and 6** to see how much salt should be used on a 20 ft driveway and **follow the steps 1-4 above!**

Salt is not intended for grit or traction. If you are spreading more and more salt, without waiting for it to dissolve, so that you can walk on the crystals and have a grip on the ice, you are using salt incorrectly. **Instead, reach for a product like sand or gravel to provide a layer of traction between your boot and the ice.** Plus, at the end of the season, you can sweep up the remaining gravel and use it again the following year, saving money and helping the environment!

Things to Consider – Clean Water is a Human Right

- Road salt pollutes waterways and increases chloride in drinking water resulting **in higher health risks for underserved communities with older and poorly maintained infrastructure.**
- This can lead to leached metals, including dangerous materials like lead, into our drinking water. Youth are especially vulnerable, as **lead can damage their developing brains and contribute to learning or behavioral problems.**
- We need congregations to fight with us on water quality issues. [Join IPC and click here to find out more about how you can advocate for positive change!](#)

FAITH IN ACTION

As a community of faith, we seek to protect the life and dignity of every person, to care for those who are vulnerable, and to preserve our common home. We believe that "*Love thy neighbor*" extends to all of creation—not just people, but butterflies and birds too!

"Do unto those downstream as you would have those upstream do unto you." ~ Wendell Berry

Islamic Faith

Water is of paramount importance connected to cleaning and healing. Water is praised as the source of all creation, per the Qur'anic dictum: "And We made from water every living thing" (21:30). O Children of Adam!... Eat and drink: But waste not by excess, for God loveth not the wasters." Surah al-Araaf (The Heights) 7:31

Jewish Tradition

According to the book of Genesis, water existed even before the creation of the world, when "the spirit of G-d hovered over the waters" (Genesis 1:2). Since then, water has played a major role in Jewish tradition. Water has been used to purify the impure, to ritually wash our hands before eating bread and water was split to show God's love and power. The word mikvah contains the same root as the word used in the Book of Genesis to describe how God brought the waters together to create oceans and land. The mikvah (ritual bath), refers to ritually washing of hands before eating bread.

Christian Prayer of Confession

Gracious God, Forgive our neglect of what you have entrusted to us as stewards. We confess that we take your gift of water for granted and acknowledge the need for repentance and action. We are reminded of your power and love with every nourishing drink, and every cleansing shower. Empower us to speak for those who are without, and to work to ensure justice and peace for all. Amen.
