

Chloride Test: Step-by-Step

1

Find a clean small glass or plastic cup. Using water from the stream, rinse out your cup 3 times.

2

Fill the cup with about an inch of stream water.*

**The test will not work if the top half of the test strip is submerged.*

3

Place the chloride test strip into the cup with the "quantab" label at the top.

4

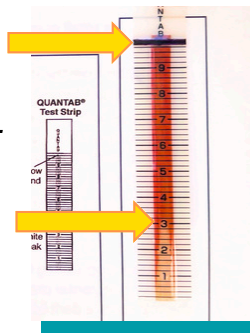

Leave the strip sitting in the cup until the horizontal yellow band at the top turns a dark blue or black. This can take up to 10 minutes.

5

To read the test strip, locate where the tip of the white peak falls on the scale. You can convert these units to parts per million (ppm) with the table on the other side of this card.

6

Follow the instructions to upload your results to the Clean Water Hub.
